Proper venting for SVT-4Pro

Question: How can I properly vent my SVT-4Pro when using in a rack?

Answer: The SVT-4Pro is rear and side vented, you should try to have good air flow. A normal rack will be sufficient for most applications (unless you're playing an outdoor gig in direct sunlight in the desert outside of Phoenix in the summer). Here are a few things to try if you have concerns about your amp overheating.

- 1) Add a small clip-on fan to facilitate air flow.
- 2) Make sure the vents on the rear are clear from obstruction.
- 3) Since power tools are fun, drill holes in the side of your rack case (Important note: REMOVE YOUR AMP FROM THE RACK BEFORE DRILLING!)
- 4) Use a shock-mount rack case. These have quite a bit more room around your gear.
- 5) Throw away your rack.

If your head starts to consistently over-heat and shut down, you may need to get some compressed air and blow the dust out of it. If your problem persists, get your amp into an authorized service center.
