## SVT-4Pro with 2 ohm load in mono/bridge mode

**Question: I have an svt4 pro. I have a 4-10 cab @4 ohms. And an 18" sub@ 4 ohms. Both are rated at 1000 watts each. In addition to running them bi-amped can I run these together in mono bridge if I want? I have the mono bridge cable to run to the first cab, then can I go right from that to the 18" sub which would give me a 2 ohm load?**

Answer: Running your cabinets this way is not recommended. While technically this would be the way to mono-bridge them, the amp specifically calls for a load of at least 4 ohms in mono-bridged mode. A load of 2 ohms will put more strain on the output section and could eventually (maybe even not-so-eventually) damage the output section. You are better off Bi-amping.
